Subject: RE: Request for final decision for manuscript number 2013_AJEA_5122

I have gone through the manuscript 2013_AJEA_5122, and I can safely say the authors did try to address issues raised by the two distinguished reviewers, but however,

1. my concern is the same as that raised one of the reviewers on the Data table. As it is, it does not show any statistical analyses were made to the data obtained. The way the “ranges” are now presented do not indicate a range at all, I still think the means are could be presented here and then the range in brackets if the authors think the SED may not be indicative enough.
2. The authors need to tell the reader which Camellia genus has been found to contain theanine, not to generalize. If the reference is there, I believe the name of the plant should not be too hard to find.

Therefore, I say if these issues are addressed, the paper can be published, as it is, it falls short of the requirements of scientific communication.
