

We thank all our noble reviewers and the managing editor for taking time to read our manuscript and making positive criticism, this we believed is for the good of the article and the journal. While some sees the study as routine work other feel it will be better for conference presentations. You are all correct, but we want it published based on the following reasons:

Niger Delta is one of the largest and oil prolific basins in the world but there are fewer literatures in this basin compared to other basins in the world such as Gulf of Mexico, North sea e.t.c. we see it as an avenue to let people have more information about the basin.

Secondly, there is a huge gap, in the third world country especially in Nigeria, between academics and oil industries and several calls have been made in respect of this. We are faced with several challenges when students on industrial attachment in the industry are having issues with some basis. This work will serve as one of the means of closing the gap. In collaboration with some professionals we are also working on the basic workflow on **field evaluation** with case study from Niger Delta (seismic interpretation, synthetic seismogram generation, petrophysics, velocity modeling and reserve calculation).

Furthermore, one of our reviewers said that this paper should be presented in a conference, we appreciate that, but not all students have the financial capabilities to attend a conference but publishing this paper in your journal will give accessibility to many students and others that are interested in Niger Delta.

Finally, we would appreciate if your editorial board cannot classify this paper as a research paper, they could classify it as review paper or case studies.
