

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	British Journal of Applied Science & Technology
Manuscript Number:	2013_BJAST_8279
Title of the Manuscript:	Estimation of environmental chemical pollution of Al-Baiji Oil Refinery in Iraq

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
1. It is part of our responsibilities as teachers/supervisors of students to ensure proper study design and execution, to guarantee sound and publishable results, particularly for students at post graduate (Msc & Ph.D) levels. Beyond this point, it becomes our responsibility to extract materials from student's thesis and articulate/organize them (with additions, removals or otherwise) and perfect them technically and grammatically to produce good journal articles out of them. 2. Truly, at this stage (i.e., after thesis had been submitted), it appears that not much may be done to address some of the technical deficiencies earlier highlighted (because most of them arose due to poor study design), since the study that produced this manuscript seems to have been concluded and thesis submitted. 3. In terms of grammatical improvement, though the author highlighted portions where correction of tenses was effected, there are others to be made better. 4. A better manuscript could have been made out of this, but the comments of the author as highlighted above shows that he/she appears unwilling to go any further, since according to him/her, "I do not think there is a complete study anywhere". FINAL COMMENT (TO THE JOURNAL EDITORS) Based on my comments above, there is now need for an in-house editorial touch on the manuscript to perfect it for publication, depending on what you consider well enough for the set standards of your journal. By this, I mean to leave the final decision on this manuscript to the discretion of the journal's in-house editorial team's final judgement.	With my respect I went through your final revision of MS.I done some corrections to improve the paper.
