Subject: Re: Request for final decision for manuscript number 2013/BJAST/6964

British Journal of Applied Science & Technology

Regarding the manuscript number **2013/BJAST/6964** I found all comments of the reviewers is considered by authors. By the way I think they could do some statistical analysis on their valuable data and find that people from which area prefer to buy drug without prescription. Also is there a significant difference between the age groups and their responses to the key questions? The reasons given by sellers and/or buyers could also analyze statistically. The finding from these analyses can be useful for health authorities to make a new approach for health system and encourage people to avoid using medication without prescription.

More comments:

- Line 143 of the pdf version of the revised manuscript "Distribution of customers", this title doesn't cover the contents of the relevant paragraph, because it is just the age distribution. So it is better to change to age distribution, or the author suggested adding the geographical distribution of the customers as well.
- There are 2 tables 4. It is needed to change the number of tables from 1-5 to 1-6.
- Title of table 4 (main reasons given by) is not clear. It is suggested to change to: Main reasons given by pharmacists to selling medications without prescription, Abu Dhabi, 2013.
- Title of table 5 (reasons given by buyers....) is also suggested to change to Reasons given by buyers for buying medication without prescription, Abu Dhabi, 2013.
- It is suggested to add some words about the type of medication that selling without prescription. Is it possible to buy all medications in the study area or there is level?
