

Editor's Comment:

After reading this manuscript and the reviewer comments at each step I recommend its acceptance for publication. It's a very interesting paper that achieve, in my opinion, an useful study that can be applied to the measurements of EEG signals to help physically limited people. The authors have followed the reviewer indications and answered the provided questions. I've only some style comments, regarding some errata detected in the final modified version (there are many words without the correspondent space between them), as well as the recommendation of numbering the equations included (it would be better to centre them). Also at page 2, fourth paragraph, first line, "Among the various researches that have.." instead of "has", etc... Check the entire manuscript to correct these errata. Additionally, the figures (Figure 1 caption must be moved to page 3) have a format that make them difficult to read (Figure 2 and following). Perhaps the format used is jpg and a different format could be employed, such eps or png.

Once these format issues are corrected this paper can be published in this journal.
