TECHNOLOGY TRANSFER AND THE NIGERIAN EXPERIENCE

¹*Moses C. Ekperiware and Adeyemi Adepoju

Abstract

Technology transfer (TT) as being widely described as an application of knowledge in the form of skills, technical know-how, design, machinery and other capital equipment in a new ground. . Meanwhile, foreign direct investment (FDI) is explained as a channel of international technology transfer (ITT) is investment made to acquire a lasting management and interest of asset in a domicile. Domestic investment (DI), human capital and the degree of openness are crucial variables used in this study mechanism. The belief and acceptance of the twin concept of FDI and TT as a tool for economic growth and convergence in LDC has been on the upsurge to the extent of it been a regular item in macroeconomic policy objectives and object of desired attainment. It is now a debate if exogenous or endogenous factors drives economic growth. Our objective for this research is to present the trend and ascertain the impact of FDI, technology transfer and openness of the Nigerian economy against domestic investment and the available human capital resource on economic growth.

Analytical measure was used to present the trend of the variables and econometric methodology was used to provide empirical evidence on the impact of endogenous and exogenous variable in the Nigeria context.

Conclusions from the findings were that domestic and external variables constitute economic growth drivers. Furthermore, human capital was crucial for both domestic and foreign investment to thrive. Technology transfer (TT) causes economic growth but international channels of TT does not favor economic growth. Similarly, degree of openness was found not to be a favorable channel; rather channels like University Industry (U-I), TT and taking intellectual properties to the market will propel economic growth. However, as macroeconomic activities increases, there is the need for deliberate effort geared towards increasing human capital investment and good foreign policies to make the foreign scene more additive to economic growth in the country.

Keywords: Technology transfer (TT), foreign direct investment (FDI), Human capital (HC), openness and economic growth (GDP)

1 Introduction

Technology transfer (TT) is the application of knowledge in the form of skills, technical know-how, design, machinery and other capital equipment in a new ground. FDI as a channel of TT which is investment made to acquire a lasting management and at least ten (10) percent interest of asset in a domicile (IMF, 1999; Dutse, 2008).

A strategic factor that influences economic growth in any country is investment. It is characterized as crucial in increasing the level of productivity. A strong correlation between investment (domestic and (or) foreign investment) and economic growth has been revealed by both theoretical and empirical studies by economists in both developing and developed economies of the world (Adofu, 2010). Nigeria has witnessed high inflow of FDI as a result of investment in the Global System of Mobile (GSM) telecommunication since 2000. The oil sector of the economy has also witnessed an increased level of FDI as evidenced by the increasing numbers and operations of oil Multinationals Corporation in the country (Kolawole and Henry, 2009).

FDI is a key channel in promoting TT for economic growth and development in developing countries (Kabir, 2012). In every FDI, there is an inbuilt TT content, management skills, marketing know-how, creation of employment opportunities and market access, which by extension increases the productivity in the host country. These skills spillover to domestic enterprises hence, FDI contributes to the economy as domestic

¹National Centre for Technology Management, Obafemi Awolowo University (OAU), Ile-Ife, Nigeria, mosekperi2002@yahoo.com

investment. In order to take advantage of this advanced technology, the host country is regarded by many scholars to have a minimum threshold of the stock of human capital. The structure of the host country's economy is also of importance to the level of benefits that can be harnessed from FDI (Kaye-anne, B. and Kelvin, G., 2005).

Domestic investment (DI), human capital (HC) and the degree of openness are also crucial variables considered in this study mechanism. Human capital as the input in the production process is a catalyst for TT and FDI as it is crucial in domiciling the foreign knowledge for domestic economic use (Folorunso, 2009). The proponent to which Nigeria import and export activities is efficient in telling us the returns from globalization, if the interaction is beneficial to the country in achieving her vision 2020. The Vision 2020 document predicts that by the year 2020, Nigeria – Africa's most populous nation and the world's 6th largest crude oil exporter would have experienced the catch-up industrialization, which will catapult it into the ranks of the 20 largest global economies. The global largest economies currently are countries of the Organization for Economic Cooperation and Development (OECD) plus China, India, Russia Brazil etc. (Enwere, 2009).

The objective of this paper is to present the trend and ascertain the impact of FDI, technology transfer and openness of the Nigerian economy with regards to domestic investment and the available human capital resource for economic growth. Furthermore, the belief and acceptance of the twin concept of FDI and TT as a tool for economic growth and convergence in LDC has been on the upsurge. This is to the extent of its inclusion in macroeconomic policy objectives and collectively desired to be attained. This paper will go to justify the potentials of TT, FDI, openness and human capital variables in achieving her economic dreams.

2 Foreign Direct Investment in Nigeria

FDI comprises not only merger, acquisition and new investment, but also reinvested earnings and loans and similar capital transfer between parent companies and their affiliates. Countries could be both host to FDI projects in their own country and a participant in investment projects in other countries. A country's inward FDI position is made up of the hosted FDI projects, while outward FDI comprises those investment projects owned abroad (Dutse, 2008).

Crude oil refining, transportation and storage, Production of liquefied natural gas, Manufacture of gas cylinders, valves and burners, Processing plant for refined mineral oil, petroleum jelly and grease, Chemical industries, Fertilizer plants, Petrochemical plants. In the telecommunication sector, since 2000 there has also been FDI into this sector. Another area that is worth mentioning is the fast food restaurant industry. Various kind of fast food restaurants are now located in major cities of the country. The trend of the components of FDI is illustrated in the figure 1 below.

Source: Plotted with figures from CBN (2008)

Figure (1): Trend of FDI Components

From the chart above, the additive of FDI to economic growth is obvious as it trends upward in pairwise relation with RGDP.

3 Technology Transfer (TT) in Nigeria

Dantas (2007) defined TT as the processes by which technological knowledge moves within or between organizations. International technology transfer (ITT) refers to the way in which this occurs between countries. He further explained that the technological knowledge that is transferred can assume various forms. TT is a package, visible or not visible of idea, skill and tacit knowledge to a new ground. It can be embodied in goods (including physical goods, plant and animal organisms), services and people, and organizational arrangements, or codified in blueprints, designs, technical documents, and the content of innumerable types of training. It can equally be communicated through flows of tacit knowledge that has not been fully codified, and remains embodied in the skills of people. TT is a package, visible or not visible of idea, design, skill, tacit knowledge to a new ground. For example, the use of ICT software and hardware in banks, also in the power sector, Nigeria uses 100 percent imported technology (Sam, 2011). The indigenous education system, if sound, with the passage of time should domesticate these technologies for local and industrial use.

Technology transfer (TT) is known as an application of knowledge. There are three main players in this process: universities for example Obafemi Awolowo University (OAU) or research centers; National Office for Technology Acquisition and Promotion (NOTAP); and industry (Benue Cement Company (BCC) Nigeria Ltd) or the public.

In Nigeria, TT is managed by The NOTAP, an agency under the aegis of the Federal Ministry of Science and Technology was established by Decree No. 70 of 1979, as the National Office of Industrial Property (NOIP). NOTAP activities include but not limited to the Evaluation/Registration of Technology Transfer Agreements; Promotion of Intellectual Property; Technology Advisory and Support Services; Commercialization of R&D Results; Research Industry Linkage; Production of Compendium Management Information System; Publication of Project Profiles on R&D Results. Nigeria may have saved over ₦90 billion from technological transfer agreements between 1983 and 2006, disclosed by NOTAP. A total of 4,529 Technology agreements were registered from 1983 to December 2009. The Service sector having the highest number of TT deals with 1,748 agreements. Taking technology education to schools and Mapping TT in tertiary institutions would increase technology human capability and infrastructure development in the country. This people are doing a great job, but a lot of fallow ground is still yet to be ploughed for technology adoption and adaption in the country. Below are recorded TT deals from 1983 to 2009;

Table (1): Number of Technology Transfer (TT) Agreements and per Sectors in Nigeria (1983 – 2009)

YEAR	TOTAL TT REGISTERED	TT AGRO	TT SMC	TT ENG	TT SER	GDP (Nominal)
1983	231	73	48	89	21	53,107.38
1984	116	44	31	31	10	59,622.53

Solid Mineral and Chemical Sector (SMC), Service sector (SER), Agro-Allied sector (AGRO), Engineering sector (ENG) and Gross Domestic Product (GDP).

Furthermore, an empirical finding of the effect of technology transfer activities in the country on economic growth is germane. Regressing past TT deals (TT(-1)) from 1999 to 2009 on GDP in logarithm is thus;

Table (2): Regression of TT content effect on GDP

Dependent Variable: LOG(GDP)

Sample(adjusted): 2000 2009

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	10.11304	0.611848	16.52867	0.0000
LOG(TT(-1))	0.656930	0.131911	4.980091	0.0011
R-squared	0.756107	Mean dependent var	13.15233	
Log likelihood	6.723927	F-statistic	24.80130	
Durbin-Watson stat	1.244653	Prob(F-statistic)	0.001079	

Source: Computed by Author (2011)

From table 2, the result showed that past TT agreement added to GDP by 66% of every agreement with strong statistical proof. The regression result shows that the model is in line with statistical requirement as the *t* and *f* tests showed that the model is statistically significant at 5 percent level required in the social science. The

coefficient of determination (R^2) showed that the model explains 76 percent determinant of the dependent variable. From the result above, TT is additive to economic growth in Nigeria and if intensified, will help the country achieve the required economic development. The choice of lag logarithm is that the effect of such TT agreement is expected to materialize with time at least a year. And the log allow for ease coefficient explanation of variable effect on the dependent variable. The result showed that every TT agreement add to GDP by 66% with strong statistical proof.

4 FDI, Technology Transfer and Economic Growth Nexus in Nigeria²

Empirical evidences (Romer (1986); Lucas (1988); UNCTAD (2000), and Dutse (2008)) seem to support the assertion that foreign firms through FDI do transfer technologies to their affiliates. This process which can equally allow positive externalities to unaffiliated firms in Nigeria and can in turn increase growth through productivity and efficiency gains by local firms. Examples of these firms are; fast food restaurants, manufacturing firms, oil and gas, and communication sectors and the banking firms etc. so the degree of openness of the country is additive to economic growth (Lee, 2012).

FDI also contributes to economic growth via technology transfer. Trans-nationals companies (TNCs) can transfer technology either directly (internally) to their foreign owned enterprises (FOE) or indirectly (externally) to domestically owned and controlled firms in the host country (Blomstrom et al., 2000; UNCTAD, 2000). Spillovers of advanced technology from foreign owned enterprises to domestically owned enterprises can take any of four ways: vertical linkages between affiliates and domestic suppliers and consumers; horizontal linkages between the affiliates and firms in the same industry in the host country; labour turnover from affiliates to domestic firms; and internationalization of R&D (Blomstrom and Kokko, 1998).

According to Enwere (2009), the rising and falling of a nation's economy and technology depends on their ability to adopt and adapt these new technologies. The state of technological capability in Nigeria is worrisome. The prospects for development of the knowledge stocks necessary and sufficient to kick start a sustained industrial revolution is not fully in place now and needs more adoption and adaption of such technologies.

In Nigeria for instance, R & D expenditure as a percentage of GDP is very low. The number of scientists and engineers in R & D (per million populations) is less than 5, patents production is almost zero, weak institutions, manufactured exports constitute less than 5 percent of total merchandise exports. Still, per capita income is about \$400, which is less than Ghana's \$600 and less than 10 percent of Malaysia's roughly \$5000. Nigeria's low score on S & T manpower reveals indirect evidence of the economy's weak innovation capability. It also explains why Nigeria has so far been unable to put manufactured exports on the world market let alone ECOWAS market (Enwere, 2009).

5 Internal Versus External Variables and Economic Growth Nexus

Bengos and Sanchez-Robles (2003) asserted that even though FDI is positively correlated with economic growth. Host countries require minimum human capital, economic stability and liberalized markets in order to benefit from long-term FDI inflows. On the other hand, the endogenous school of thought opines that FDI also influences long-run variables such as research and development (R&D) and human capital (Romer, 1986; Lucas, 1988). So, domestic economic activities are crucial in attracting foreign investment. A level of human capital and infrastructural baseline is a prerequisite in attracting FDI. Investment in critical sectors like electricity, human

²FDI is one of the strategies for promoting TT in enhancing economic growth and development in developing countries. 'In every FDI, there is an inbuilt TT content'.

capital, financial services, political stability, roads and security are germane to attracting FDI and economic growth in Nigeria.

Indigenous technological capability policies such as education, technical training, and R&D, increase the aggregate rate of technology transfer from FDI. Export promoting trade regimes (openness) are also important prerequisites for positive FDI impact to reduce technological gap existing between developed and undeveloped countries (Ayanwale, 2007).

Balasubramanyan *et al.* (1996) report positive interaction between human capital and FDI. They had earlier found significant results supporting the assumption that FDI is more important for economic growth in export-promoting than import-substituting countries. This implies that the impact of FDI varies across countries and that trade policy can affect the role of FDI in economic growth.

The pace of technological change in the economy as a whole will depend on the innovative and social capabilities of the host country with the absorptive capacity of other enterprises in the country. Other than the capital augmenting element, some economists see FDI as having a direct impact on trade in goods and services. Trade theory expects FDI inflows to result in improved competitiveness of host countries' exports (Blomstrom and Kokko, 1998).

Dutse (2008) reported that the role of FDI in technology transfer and economic growth in Nigeria are for the reasons summarized as follows:

Facilitating Technology Spillover; FDI spillovers may occur in Nigeria through a variety of activities, including labour and management training, technological copying, demonstration, direct licensing of technology, and vertical linkages in the production and distribution value chains. Empirical Evidences show that the generated spillovers depends on the absorptive capacity of local firms, limited technological gap between foreign and host country firms, and complementarity of foreign and host country technologies, the nature of FDI, the motives and attributes of the foreign investors, high education levels, wealth, fully developed financial markets, and trade openness (Borensztein *et al.*, 1998; Balasubramanyam *et al.*, 1996).

Encouraging Innovation; Innovation is one of the direct benefits of FDI. It forces local firms to innovate to remain competitive by increasing competition in the host country market. Moreover, Nigerian firms could appropriate productivity benefits from R&D performed by foreign owned firms regardless of where it is performed through imports of intermediate goods produced by the foreign firm and through other channels as evidenced by the work of (Bernstein and Mohnen, 1998).

Allowing Technology Adoption; OECD (2002) reported that FDI may further lead to technology adoption by Nigerian firms through establishing linkages with domestic firms via subcontracting and other mechanisms. By implication Nigerian firms may adopt technologies introduced by foreign firms through imitation, reverse engineering, or vertical linkages.

Developing Local Human Capital; there exist some empirical evidence that affiliates of foreign firms tend to provide training and learning than those domestic enterprises, (OECD 2002). Foreign firms operating in Nigeria can enhance internal human capital Nigeria's economic growth. Foreign direct investment can enhance transfer of technology communications through training and on-the-job learning. Physical movement of workers, the human capital e.g. knowledge embodied in workers could be transferred to other components of the host economy. In the words of Sam (2011), 'I have seen in the power sector, consultancy for a foreign company to come here to do feasibility and checking the status of power plants for more than \$20 million. It is alarming seeing this kind of thing'. TT helps to cover the needed gap between developed and underdeveloped.

6 Method of Estimation

The method of estimation used is the Ordinary Least Square (OLS). We choose the OLS because the response variable (GDP) is continuous and its reaction to the explanatory variables will be well approximated by a

linear regression equation. Graphs were also used to show the economic dynamics and basis for our qualitative discussions. Critical study period is from 1980 to 2008. Secondary data used were sourced from the Central Bank of Nigeria (CBN) Statistical Bulletin (2009) and NOTAP 2011. Analytical measure was used to present the trend of the variables and econometric methodology was used to provide empirical evidence on the impact of endogenous and exogenous variable in the Nigeria context.

Keynes open macroeconomic model was adopted to augment the impact of domestic and foreign variable to make vivid their effect on economic growth in Nigeria. The four sector economic model explains (if not all) the determinants of economic performance of a country. Precisely,

$$Y = F(C, I, G, NETEXPORT) \dots \dots \dots (1)$$

Where, Y= Economic growth, C= aggregate consumption, I= Investment, G= Government expenditure and Netexport= Export minus Import. Equation (1) can be further re-specified as

$$GDP = F(HC, DI, NETEXPORT, OPENNESS, FDI, EXRATE) \dots \dots \dots (2)$$

Where GDP = Gross domestic product measuring economic performance.

HC = Human capital investment measuring the available educational capability in the country.

DI = Domestic investment measuring physical capital formation in the country.

NETEXPORT = Export minus import measuring the rate at which the country bring in goods and services compared to the rate the economy can produce and sell to the outside world.

OPENNESS = Export plus import divided by GDP measuring the degree of globalization and its effect on economic growth.

FDI = Foreign direct investment measuring the number of foreign companies coming to reside in the country for economic purpose.

EXRATE = the official value of which Nigeria Naira is exchanged with the monies of other countries, E.g. US dollar.

A statistical presentation of equation 2 thus;

$$GDP = \beta_0 C + \beta_1 HC + \beta_2 DI + \beta_3 NETEXPORT + \beta_4 OPENNESS + \beta_5 FDI + \beta_6 EXRATE + U \dots (3)$$

The variables are expected to be positively related to GDP and coefficient of determination expected to be high in that the variable comprises almost all economic activities in a small open economy like Nigeria.

The need to examine the correlation characteristics of the variables is germane to ascertain the interrelations. Below is the correlation characteristic of variable to ascertain how they relates.

229 **Table (3): CORRELATION OF VARIABLES**

	DI	EXRATE	FDI	HC	NETEXPORT	OPENNESS	RGDP	TT
DI								
EXRATE	0.867396*							
FDI	0.895308*	0.901795*						
HC	0.768720*	0.892518*	0.944774*					
NETEXPORT	0.667496*	0.787696*	0.883725*	0.887302*				
OPENNESS	0.717790*	0.584800*	0.629374*	0.491564**	0.467685**			
RGDP	0.802762*	0.855028*	0.904541*	0.853447*	0.796516*	0.622739*		
TT	0.777143*	0.938749*	0.916345*	0.942998*	0.905082*	0.493247**	0.831961*	

230 *Author's construct 2013: * strong correlation and ** connotes weak correlation*

231 Table 3 showed that the degree of openness has weak correlation to human capital technology transfer (TT) and
 232 netexport. The correlation of openness and exchange rate is not too strong too.

233 Below is the estimate of the regression result.

234 **Table (4) Econometric Result of Internal versus External Variables and Economic Growth Nexus in Nigeria**

Dependent Variable: GDP

Sample: 1980- 2008

Variable	Coefficient	t-Statistic	Prob.
C	479733.6	0.691218	0.4967
HC	47.10354	5.015963	0.0001
D(DI)	6.909846	0.729836	0.4732
NETEXPORT	1.526240	5.327153	0.0000
OPENNESS	-1637738.	-1.063942	0.2989
FDI	14.56349	2.386886	0.0260
D(EXRATE)	-32061.94	-2.305465	0.0309
Adjusted R-squared	0.982929	Mean dependent var	4539573.
Durbin-Watson stat	1.785223	Prob(F-statistic)	0.000000

235 Source: Computed by Author (2013)

236 In table (4), first the variables were processed to their stationary state to avoid being spurious. Examination
 237 of the variables after taking them to their stationary state showed that human capital, FDI and exchange rate are
 238 statistically significant at 5%, openness at 10% except domestic investment (DI) and netexport that were not
 239 statistically significant. With 98% coefficient of determination and statistically significant f -statistic of the
 240 regression indicate that the model is of best fit on the whole. Our findings showed that an increase in FDI by one
 241 unit will on the average cause an increase in GDP by 14.6 units. netexport was also positively relating to GDP. A
 242 change in the degree of openness and exchange rate showed contrary result as they negatively relate to GDP. This
 243 is in line with our earlier correlation hunch about openness.

On the domestic scene, a unit increase in domestic investment (DI) causes 6.9 units increase in GDP. Also, on the average, one unit increase in human capital causes 47 units increase in GDP.

8 Conclusion

Conclusions from the findings were that domestic and external variables are economic growth drivers and human capital is crucial for both domestic and foreign investment to thrive. Technology transfer (TT) favours economic growth but international channels of TT are not favoring economic growth because the degree of openness is not a favorable. Meanwhile, channels like University Industry (U-I) TT that takes intellectual properties to the market will propel economic growth. However, as macroeconomic activities increases, there is need for deliberate effort to increase human capital investment and good foreign policies to make the foreign investment more favourable to economic growth in the country.

Thus, this paper strongly support innovation and technology transfer as key drivers of economic growth in today's world economy and specifically in Nigeria. Hence, an appropriate economic policy should concentrate on strengthening these processes throughout the country and ease the flow of information and technology between the various actors and stakeholders within the national system of innovation such as – innovators, tertiary institutions, companies, state agencies and financial institutions.
