

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	British Journal of Economics, Management & Trade
Manuscript Number:	2013_BJEMT_5991
Title of the Manuscript:	Unemployment and Crime in Nigeria: A Panel Data Analysis

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
If Figures 1 through 8 are not part of literature review, as the authors stated, then they should not be included in the literature review section. They should be included in the "RESULTS" section and labeled "Preliminary Analysis." If these figures are left as they are, they become part of the literature review, and by definition they are placed in the wrong section. Any type of analysis conducted by authors should be placed in the results and discussion section. This includes all Figures 1 through 8. Variables in tables 2b, 3a, 3b, 4a, 4b, and 5 should be spelled out. Author(s) should not use abbreviated versions of variables when they present the results. I'm a reviewer for eight different journals and never seen authors using abbreviated codes to refer to variables when they present the results. The authors have included three additional sentences comparing the results of the current study with previous studies. However, they did not include the references for those previous studies in the concussion section. In other words, when you compare your research findings with other research studies, you need to include the references for those studies that you are using for comparison. The question that every researcher will ask is which studies produced similar results as the current study? And which studies did not produce similar results as the current study. You need to reference those few prior studies in your conclusions. If you are comparing research results, and you should, then you need to show which previous studies you are using as comparison.	Figures are moved to section 3 and titled as suggested while section 4 is now titled Presentation and Discussion of Regression Results Spelled out variables as suggested Included Same references at concluding section
