

**Original Research Article****ANTIDIABETIC ACTIVITY AND MODULATION OF ANTIOXIDANT STATUS BY  
*OCIMUM CANUM* IN STREPTOZOTOCIN-INDUCED DIABETIC RATS****ABSTRACT**

The aqueous extract of *Ocimum Canum*. (Family: Lamiaceae) leaf was investigated for its antidiabetic effect in Wistar Albino rats. Diabetes was induced in Albino rats by administration of streptozotocin (45mg/kg, I.P). The aqueous extract of *Ocimum canum* at a dose of 100mg/kg and 200mg/kg of body weight was administered to diabetes induced rats for a period of 28 days. The effect of aqueous extract of *Ocimum canum* leaf extract on blood glucose, plasma insulin, glycosylated haemoglobin, serum lipid profile low density lipoprotein (LDL), very low density lipoprotein (VLDL), high density lipoprotein (HDL), atherogenic index and the activities of alanine aminotransferase (ALT), aspartate aminotransferase (AST) and alkaline phosphatase (ALP) of all groups were analyzed. Antioxidant enzymes catalase (CAT), superoxide dismutase (SOD), reduced glutathione (GSH), serum thiobarbituric (TBAR) were measured in the diabetic rats. The aqueous extract of *Ocimum canum* leaf elicited significant reductions of blood glucose ( $p < 0.01$ ), lipid parameters except HDL-C, serum enzymes and significantly increased HDL-C and antioxidant enzymes. From the above results it is concluded that aqueous extract of *Ocimum canum* possesses significant antidiabetic, antihyperlipidaemic and antioxidant effects in streptozotocin induced diabetic rats.

**Keywords-** *Ocimum Canum*, Antidiabetic, Antihyperlipidaemic, Antioxidant, streptozotocin

**INTRODUCTION:**

Diabetes mellitus is a metabolic disorder featured by hyperglycemia and alterations in carbohydrate, fat and protein metabolism associated with absolute or relative deficiency of insulin secretion and/or insulin action. It is one of the oldest diseases affecting millions of people all over the world. According to recent estimates the prevalence of diabetes mellitus is 4% worldwide and that indicates 143 million persons are affected which will increase to 300 million by the year 2025. Although numerous oral hypoglycemic drugs exist alongside insulin, still there is no promising therapy to cure diabetes (1). Over the last few decades the reputation of herbal remedies has increased globally due to its therapeutic efficacy and safety. In recent years, numerous traditional medicinal plants were tested for their antidiabetic potential in the experimental animals (2). In the present investigation, *Ocimum Canum*. leaves were tested for their antidiabetic efficacy. *Ocimum canum* (Family: Lamiaceae) is widely used in Indian traditional medicines have been used in successful management of various disease conditions like bronchial asthma, chronic fever, cold, cough, malaria, dysentery, convulsions, diabetes, diarrhea, arthritis, emetic syndrome, skin diseases, insect bite etc and in treatment of gastric,

39 hepatic,cardiovascular & immunological disordersthe present study was designed to investigate  
40 the antidiabetic efficacy of aquous extract of *Ocimum canum*leaf in streptozotocin induced  
41 diabetic rats.

#### 42 **MATERIALS AND METHODS:**

43 **Plant material:.** Leaves of *Ocimum canum* were collected in the month of November 2011 from  
44 its natural habitat from nearby Dasapalla forest division, Nayagarh district of Odisha,India. The  
45 plant was authenticated from National Botanical Research Institute (NBRI)Lucknow by Dr  
46 C.H.V.Rao. The leaves were cleaned and dried under the shade to avoid degradation of volatile  
47 oil.

48 **Preparation of plant extract for Phytochemical Screening and Antidiabetic Studies:** The  
49 *Ocimum canum* leaves were shade dried at room temperature and the dried leaves were  
50 powdered in a Wiley mill. Hundred grams of powdered *Ocimum canum* leaves was packed in a  
51 Soxhlet apparatus and extracted with water. The extract was subjected to qualitative test for the  
52 identification of various phytochemical constituents as per standard procedures(3).. The  
53 concentrated aquous extract were used for antidiabetic studies.The phytochemicals like  
54 Alkaloids ,Carbohydrates,,tannins, flavonoids, terpinoids are found.(4)  
55

56 **Animals:** Normal healthy male Wistar albino rats  $200 \pm 25$  gm were used for present  
57 investigation. Animals were housed under standard environmental conditions at temperature  
58 ( $25 \pm 2^\circ\text{C}$ ) , light and dark (12:12 h). Rats were feed standard pellet diet ((golden feed, New Delhi  
59 and water regularly) .

60 **Acute Toxicity Study:** Acute oral toxicity study was performed as per OECD-423 guidelines  
61 (acute toxic class method), albino rats (n=6) of either sex selected by random sampling were  
62 used for acute toxicity study (5). The animals were kept fasting for over night and provided only  
63 with water, after which the extracts were administered orally at 5mg/kg body weight and  
64 observed for 14 days. If mortality was observed in two out of three animals, then the dose  
65 administered was assigned as toxic dose. If mortality was observed in one animal, then the same  
66 dose was repeated again to confirm the toxic dose. If mortality was not observed, the procedure  
67 was repeated for higher doses such as 50, 100, and 1000 mg/kg body weight. All animal  
68 experiments were approved by Institutional Animal Ethics Committee (IAEC) of PBRI, Bhopal  
69 (Reg No. - 1283/c/09/CPCSEA).

70 **Induction of Experimental Diabetes:** Rats were induced diabetes by the administration of  
71 simple intraperitoneal dose of streptozotocin (45 mg/kg) . Two days after streptozotocin  
72 injection, rats screened for diabetes having glycosuria and hypoglycaemia. All animals were  
73 allowed free access to water and pellet diet and maintained at room temperature in plastic cages.

74 **Experimental Design:** In the investigation, a total of 30 rats (24 diabetic surviving rats and 6  
75 normal rats) were taken and divided into five groups of 6 rats each. Group I: Normal, untreated  
76 rats Group II: Diabetic control rats Group III: Diabetic rats given aquous extractof *Ocimum*  
77 *canum* leaf (100 mg/kg of body weight) Group IV: Diabetic rats given aquous extractof *Ocimum*  
78 *canum* leaf (200 mg/kg of body weight) Group V: Diabetic rats given standard drug  
79 glibenclamide (600 $\mu\text{g}$ /kg of body weight)

80 **Biochemical Analysis:** The animals were sacrificed at the end of experimental period of 28 days  
81 by decapitation. Blood was collected, sera separated by centrifugation . Serum glucose was  
82 measured by the O-toluidine method (6). Insulin level was assayed by Enzyme Linked

83 Immunosorbant Assay (ELISA) kit (7). Glycosylated haemoglobin (HbA1C) estimation was  
 84 carried out by a modified colorimetric method of Karunanayake and Chandrasekharan (8).  
 85 Glycosylated haemoglobin, serum lipid profile low density lipoprotein (LDL), very low density  
 86 lipoprotein (VLDL), high density lipoprotein (HDL), atherogenic index and the activities of  
 87 alanine aminotransferase (ALT), aspartate aminotransferase (AST) and alkaline phosphatase  
 88 (ALP) was measured by the method of King and Armstrong (9). Catalase (CAT) (10),  
 89 superoxide dismutase (SOD) (11), lipid peroxidation (LPO) (12), reduced glutathione (GSH)  
 90 (13), serum thiobarbituric (TBAR) (14) were analyzed in the normal, diabetic induced and drug  
 91 treated rats.

92 **Statistical Analysis:** The data were analyzed using student's t-test statistical methods. For the  
 93 statistical tests p values of less than 0.01 and 0.05 was taken as significant.

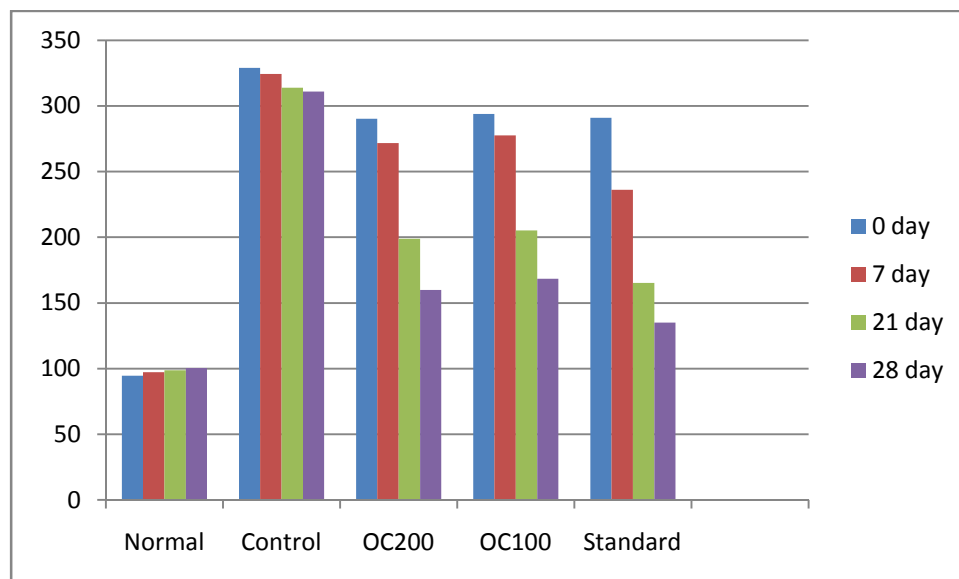

## 94 RESULTS AND DISCUSSION:

95 The phytochemical screening of aqueous extract of *Ocimum canum* leaf revealed the presence of  
 96 alkaloids, flavonoids, glycosides, terpenoids, tannins, phenols, saponins and steroids. Acute  
 97 toxicity study revealed the non-toxic nature of the aqueous extract of *Ocimum canum* leaf. The  
 98 streptozotocin induced diabetic rats elicited significant rise in blood glucose from  $94.5 \pm 4.5^{**}$  to  
 99  $329.16 \pm 25.50$  mg/dl ( $p < 0.01$ ). On the contrary, diabetic rats treated with aqueous extract of  
 100 *Ocimum canum* exhibited decrease blood glucose significantly at a dose of 100 mg/kg and 200  
 101 mg/kg body weight (Table 1).

102 **TABLE 1:**  
 103 **Effect of aqueous extract of *Ocimum canum* leaf on blood glucose, after prolonged treatment**

113

The hypoglycemic aqueous extract of *ocimum canum* leaf was found to decrease the blood glucose level. Streptozotocin induced diabetic rats showed significant decreased ( $p < 0.01$ ) blood glucose level compared with normal rats.. The levels of serum lipid profile ALT,AST,ALP,PRO,CHO,HDL,LDL,VLDL of control and streptozotocin induced diabetic rats were presented in **Table 2**.

127 **Fig-2**

128

129 A significant reduction in serum lipid profile ALT,AST,ALP,PRO,CHO,HDL,LDL,VLDL  
 130 observed.. **Table 2** summarized the effect of streptozotocin on the activity of the hepatic marker  
 131 enzymes in serum. The effect of glibenclamide on the recovery of hepatic enzyme activity in  
 132 serum was very similar to that of the earlier study (15).. In addition to the assessment of SGPT  
 133 and SGOT levels during diabetes the measurement of enzymatic activities of phosphatases such  
 134 as atherogenic index and the activities of alanine aminotransferase (ALT), aspartate  
 135 aminotransferase (AST) and alkaline phosphatase (ALP) of all groups were examined.. Elevated  
 136 level of this enzyme in diabetes may be due to extensive damage to liver in the experimental  
 137 animals by streptozotocin.

138 Treatment with aqueous extract of *Ocimum canum* in streptozotocin induced diabetic rats  
 139 produces a significant (p<0.05) decline in ALP level. The levels of serum lipid profiles,LDL-C,

140 VLDL-C, and HDL-C in control and experimental animals were investigated . Streptozotocin  
 141 induced rats showed significantly increased serum lipid profiles except CHO and PRO when  
 142 compared with normal rats. The glibenclamide and aqueous extract of *Ocimum canum* leaf treated  
 143 rats showed a significant decrease in the content of lipid profiles when compared with diabetic  
 144 induced rats. Similarly HDL-C level decreased in streptozotocin induced diabetic rats when  
 145 compared to normal rats. On administration of aqueous extract of *Ocimum canum* leaf and  
 146 glibenclamide to the diabetic rats, HDL-C level was found to be restored to normal. The level of  
 147 serum lipid profiles are usually raised in diabetic rats in the present study and such elevation  
 148 represents risk factor for coronary heart diseases (16). The significant reduction of serum lipid  
 149 levels in diabetic rats after *Ocimum canum* treatment may be directly attributed to decreased  
 150 glucose levels .

151  
 152 **Effect of *Ocimum canum* on in- vivo antioxidant parameters**

153 The superoxide dismutase activity was found to be reduced in erythrocytes of animals treated  
 154 with streptozotocin . GSH is a major non-protein thiol in living organisms, which plays a central  
 155 role in co-ordinating the body’s antioxidant defense processes. (17) Perturbation of GSH status  
 156 of a biological system can lead to serious consequences. SOD, CAT and TBAR constitute a  
 157 mutually supportive team of defense against reactive oxygen species (ROS) The results (**Table**  
 158 **3**) showed decreased oxidant enzymes of streptozotocin induced diabetic rats.. These indicate  
 159 that, plant extract inhibit oxidative damage due to the antiperoxidative effect of ingredients  
 160 present in aqueous extract of *O.canum*.

161 **TABLE 3: Effect of aqueous extract of *Ocimum canum* leaf on the CAT, SOD, GSH, AND**  
 162 **TBAR activity of normal, diabetic induced and drug treated RAT**  
 163 **Parameters**

Group	SOD	GSH	CAT	TBAR
Normal	3.54±0.09	17.40±0.05	19.09±0.01	1.93±0.006
Diabetic control	1.39±0.08	6.63±0.15	6.71±0.10	2.87±0.004
STZ+ OC(Water) high dose 200 mg/kg	2.23±0.04	13.9±0.07	14.03±1.13	2.27±0.055
STZ+ OC(Water) low dose 100 mg/kg	1.73±0.07	9.39±0.11	12.61±0.32	2.87±0.004
Std group	2.97±0.02	16.46±0.08	18.15±0.09	2.18±0.008

164 Each value is SEM of 6 animals, comparisons were made between normal control to diabetic  
 165 control: \*p<0.05 and comparisons were made between diabetic control to drug treated groups: a  
 166 p<0.05; aa p<0.01 level

167 **Fig-3**

168

169 The levels of superoxide dismutase (SOD), catalase (CAT) reduced glutathione (GSH) and  
 170 serum thiobarbituric (TBAR) were significantly (p<0.05) reduced in streptozotocin induced rats.  
 171 These adverse changes were reversed to near normal values in aqueous extract of *O.Canum* leaf  
 172 treated. It is well known that CAT, SOD, GSH and TBAR play an important role as protective  
 173 enzymes against free radical formation in tissues (18). The present study indicates the reduction  
 174 in the activity of SOD, CAT, GSH and TBAR in streptozotocin induced rats. These results  
 175 reveal the protective role of plant extract in decreasing lipid peroxidation and by normalizing  
 176 antioxidant system.

177

178 **Histopathology**

179 For histopathological study, animals from all groups were anaesthized with mild ether  
 180 anaesthesia and dissected. pancreas are excised out of the animal's body and put immediately  
 181 into 10% formalin solution in a stoppered container. These samples were then sent to diagnostic  
 182 lab fixation (using Bouin's solution), dehydration, embedding (in paraffin), sectioning (with  
 183 standard microtome) and staining (Haematoxylin or eosin). The slides so prepared were than  
 184 examined by pathologist and the pictures were clicked with the help of a binocular microscope  
 185 fixed with a camera.

206 **CONCLUSION:**

207 In conclusion, the present study has shown that the aqueous extract of the leaves of *Ocimum*  
208 *canum* has antidiabetic and antihyperlipidaemic effects. Since the phytochemical analysis has  
209 shown the presence of potent phytochemicals like flavonoids, terpenoids, tannins, carbohydrate  
210 and phenols. Several authors reported that flavonoids, sterols/terpenoids, phenolic acids are  
211 known to be bioactive antidiabetic principles(19,20). Flavonoids are known to regenerate the  
212 damaged beta cells in the streptozotocin diabetic rats (21). Phenolics are found to be effective  
213 antihyperglycemic agents (22). In the present study, the phytochemical analysis of aqueous  
214 extract of *Ocimum canum* leaf clearly points out the presence of above said active  
215 phytochemicals. It denotes that, the antidiabetic effect of aqueous extract of *Ocimum canum* leaf  
216 may be due to the presence of more than one antihyperglycemic principle and their synergistic  
217 effects.
