Subject: Re: Request for final decision for manuscript number 2014_IJBcRR_10131

I have viewed all the documents you sent to me. I suggest to accept this manuscript.

In this manuscript, the author intended to study the prevalence of cardio metabolic risk factors in obese adolescents and to correlate these cardio metabolic risk factors with insulin resistance. The authors have surveyed 120 samples (including health control). The results shows that BMI and WC in obese group were significantly higher than health group. And find insulin resistance has a better correlation with BMI, WHR and mean artery BP. Finally, concluded that “the study clearly suggested a high prevalence of cardio metabolic risk factors among obese adolescents with elevation in insulin level and insulin resistance”.

These results could support the conclusion in statistical level based on the small sample size. However, I suggest the authors to explore the mechanisms behind these statistical correlations in their future studies.
