- This form has total 9 parts. Kindly note that you should use all the parts of this review form.

SDI Review Form 1.6

PART 2: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
<u>Compulsory</u> REVISION comments	The number of the study group is good-enough. Although there are some other studies like this, this study can be important for giving regional statistical data about thyroid neoplasm's in Ibadan region. This study doesn't give any information about diagnostic difficulties and why these patients underwent surgical resection. If any Fine Needle Aspiration (FNA) was performed, FNA findings can be given. This manuscript needs a major revision of language. Used English is not good, mostly meaning is missing. Statistical analyses findings can be added to the tables. More recent references should be added. This study is a retrospective descriptive study. It is not an original study, but gives information about the distribution of thyroid neoplasm's according to types, gender and ages in Ibadan. The findings should be compared with the world literature if there is a difference it should be discussed. If it is discussed these findings can be important. I have written more comments in the reviewed manuscript.	
<u>Minor</u> REVISION comments
