SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
<u>Compulsory</u> REVISION comments	The authors must re-write de manuscript. The results are confused due to poor stathistical methods used and probably not adequate leading to a major misunderstanding in their conclusion. There is no "p" value. Is it possible to compare such different groups in terms of "n" without an appropriate stathistical method? I do not believe so. The primary or secondary end points are not defined. The BMI and blood pressure values were described even not been considered as primary or secondary end points. How come? There is no relation between the main objective and the conclusion	
<u>Minor</u> REVISION comments	The mean diabetes duration is not specified in material and methods. The authors need to do a major review in english grammatical structure	
<u>Optional/General</u> comments	If there are any ethical issues. Please confirm.
