SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment <i>(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)</i>
<u>Compulsory</u> REVISION comments	The manuscript is excellent. The theme is very relevant. Introduction is well structured. Each paragraph discusses a different topic in clear language, but in order to relate to each other. First, stigma is conceptualized. Then there is a historical theme and its social repercussions. Finally, intervention strategies are well detailed. The methodology is well done. Selecting a community sample, randomization of the sample, choice of three communities without major differences and statistical analysis are very good. The results are statistically significant and consistent with other publications.	
<u>Minor</u> REVISION comments	Although informative and motivating the title might better contemplate the contents of the manuscript. I suggest: "The effectiveness of leprosy de-stigmatizing interventions". The graphs and tables are well explanatory. However, it might be better to unite the three graphs into one, since they relate to items of the same scale. The conclusion could also <u>highlight the importance of self-help group in the stigmatization of leprosy.</u>	
<u>Optional/General</u> comments	The article discusses the issue of stigma and shows solutions. It highlights the importance of self-help group. It's very good. The study follows the ethical principles and was approved by ethics committee. The participant could refuse participation in the study without retaliation.
