SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments		
Minor REVISION comments	In this manuscript, the authors reports of hypocholesterolemia in ART-naïve children in Nigeria. This is an interesting study bringing somehow unexpected results. The study appears well planned and is well written. The authors try to explain their unexpected results by the low dietary cholesterol levels of the patients (living on peasant meals low in cholesterol) and it might be the reason why the results in this study are different from others in other parts of the world. The authors also caution about the limits of the study because of this particular diet. In Table 1: there is "Hepatosplenomegaly: 35 patients", "Hepatomegaly: 39 patients, and "Splenomegaly: 5 patients". How are they defined clinically and why is there only 35 patients with hepatosplenomegaly if there are already 39 with hepatomegaly?	
Optional/General comments
