

Editor's Comment:

The submitted paper (2015_JAMPS_16393) was previously evaluated by number of external reviewers. However, the text cannot be published in the present form without fundamental revision. The main problem is the language and fact that the manuscript was not prepared according to journal requirements. There are number of errors especially punctuations ones (e.g., lock or double spaces). All p value should be omitted in the text, since words significant or insignificant are fully informative for potential readers. So-called the organ-body weight ratio should be stated as a relative organ weight. All values should be presented in proper SI units (see acronyms; l instead of L, etc.). The abstract does not present all aspects of the study. Typical clinical observations for toxicological studies are missing (e.g. mortality, food and water consumption, etc.). The discussion is scanty and laconic. Limitations and clinical implications of the study have to be presented. Due to low number of evaluated animals in each experimental group the obtained data is only supplementary for the human risk assessment. List of references does not pass criteria of any journal (see punctuation and journal acronyms, check the instruction for authors). All acronyms in table 1 should be replaced by proper name of the examined parameters.
