

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	Journal of Cancer and Tumor International
Manuscript Number:	2015_JCTI_18131
Title of the Manuscript:	MiRNA and target oncogenes in Triple negative breast cancer; major players in age and ethnic related neoplastic events
Type of the Article	Review Article

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
It is an important topic but is not a new presentation or outstanding discussion. The response of the authors is limited and a review is not local.	Author wish to thank the evaluator for his/her comments. However, this article (JCTI_18131) is not a research article or case report but a review article. I will like to add that, a review article does not present anything new about the topic under discussion since it is a collection of recent discoveries/report in relation to earlier reports. This review article was written to stimulate the minds of researchers to finding the cause of the increased prevalence of Triple negative breast cancer in the ethnic groups affected, especially Africa. According one of the reviewers comment "Excellent review covering extensively this particular field of research", this paper meets an acceptable level in terms of literature searches. More so, the second reviewer's corrections show that this review article meets a conventional standard but requires minor revisions which I have done (as shown in revised version 1 and 2). Anyways, I have made some additions to the discussion and conclusion as previously suggested to improve the clarity on the topic discussed.
