SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
<u>Compulsory</u> REVISION comments	English language has to be improved.	Noted, we have proof read and edited as necessary.
	Case report line 27-28 it is not clear what type of thyroidectomy the patient underwent	The patient had partial thyroidectomy (isthmusectomy) and this has been highlighted in the manuscript
	Line 32-33 it is not possible the patient had elevated T3 and Thyroid Stimulating Hormone; please indicate the values.	Apologies, we acknowledge error in printing. TFT results showed T3 hyperthyroidism. Free T4-3.5(7.2-16.4 pmol/l). Free T3-6.4(3.8-6.0)pmol/L. TSH -0.20(0.37-3.50)miU/L. We have corrected the error in the manuscript.
	Had the patient performed a cervical ultrasound? Were the cervical nodes studied with ultrasound and/or FNA?	Specific cervical ultrasound was not requested for, it was only done as part of the thyroid scan. The result has been highlighted in the manuscript. FNA was not done.
	How was the patient treated? Was she operated? Follow-up of the patient is missing	We did not include the treatment because we do not have facility for oncological treatment in the primary facility the diagnosis was made. We referred her for treatment in another state.
<u>Minor</u> REVISION comments	References are few.	Nine additional references have been included

SDI Review Form 1.6

<u>Optional/General</u> comments	The discussion could be implemented. Especially the discussion about the treatment seems to be too concise.	Our focus on this case report is to highlight the rare occurrence of Metastatic thyroid liver disease and the usefulness of histology in our part of the world especially because we have many cases of HCC
