| Journal Name:            | Physical Science International Journal                                      |
|--------------------------|---|
| Manuscript Number:       | 2014_PSIJ_12624   |
| Title of the Manuscript: | Dry Sliding Wear Behaviour of Plasma Sprayed Fly Ash Added Red Mud Coatings |
| Type of the Article      | Original Research Article   |

## **General guideline for Peer Review process:**

This journal's peer review policy states that  $\underline{NO}$  manuscript should be rejected only on the basis of 'lack of Novelty', provided the manuscript is scientifically robust and technically sound.

To know the complete guideline for Peer Review process, reviewers are requested to visit this link:

(http://www.sciencedomain.org/page.php?id=sdi-general-editorial-policy#Peer-Review-Guideline)

# **PART 1:** Review Comments

|                            | Reviewer's comment   | Author's comment (if agreed   |
|----------------------------|--|-------------------------------|
|                            |  | with reviewer, correct the    |
|                            |  | manuscript and highlight that |
|                            |  | part in the manuscript. It is |
|                            |  | mandatory that authors should |
|                            |  | write his/her feedback here)  |
| <b>Compulsory</b> REVISION | Technical:   |                               |
| comments                   | 14-15: "The wear test was performed for sliding distance of 94 to 942 m" Why different test            |                               |
|                            | lengths? In all the graphs, ~942 m is presented.   |                               |
|                            | 19: "dense film at interface" What film and what interface?  |                               |
|                            | Table 5: Please include standard deviations for the porosity values. It is important to assess         |                               |
|                            | whether the differences between the samples are significant with respect to experimental               |                               |
|                            | scatter. The porosity values are presented down to 1/100 percent precision; considering the            |                               |
|                            | large variation in coating thickness in Fig. 4, it is doubtful that porosity would be homogeneous      |                               |
|                            | even down to percent   |                               |
|                            | Why are there missing data for the 50/50 mixture? As these are significantly different from            |                               |
|                            | the others, they would be most interesting.  |                               |
|                            | Table 6: Please include standard deviations for the hardness values.                                   |                               |
|                            | 185: "The three structurally different phases of red mud coatings bear three different ranges          |                               |
|                            | of hardness" They don't seem to be very different, and their ranges often overlap. Standard            |                               |
|                            | deviations would be helpful to assess this.  |                               |
|                            | 188: "This result is attributed due to the increased content of alumina and silica in the              |                               |
|                            | composition of feed material forming alumino-silicate (mullite phase)" Was it detected, or is it       |                               |
|                            | just a guess? It may have been reported in [18], but it is just a dissertation, not broadly available. |                               |
|                            | 203: "cleaning with woolen cloth to avoid entrapment of wear debris" Entrapment where?                 |                               |
|                            | 227: "This is one fact indicating the more hardness of denser surface of top layer than that of        |                               |
|                            | bulk layer." Was there any measurement performed to confirm this hypothesis?                           |                               |
|                            | 241: "This might be due to the improper particle to particle bonding and poor stacking to the          |                               |
|                            | substrate" Was there any obervation to support this? Any reason why the trend should change            |                               |
|                            | at 15 kW?  |                               |
|                            | Fig. 10: Why are the wear scars not covering the whole area? From the experiment desciption,           |                               |

Created by: EA Checked by: ME Approved by: CEO Version: 1.6 (07-06-2013)

#### **SDI Review Form 1.6**

it seemed that the whole coating area was in contact with the disk. Are these scars from some [particularly large debris (i.e. the rest of the area is worn as well, but with a less dramatic way)?

271: "assigning to a fatigue failure in the real sense" What exactly is meant by ,fatigue in the real sense'? Cyclic loading naturally occurs in this type of experiment.

Fig. 8: Why are there these periodic variations? Thios looks like some artifact – was there any difference between even and odd measurement cycles?

338: "Addition of fly ash with red mud reduces the wear rate by enhancing the coating mechanism" What is meant by ,enhacing the coating mechanism'?

#### Grammar:

General:

Figure.# -> Figure #.

The materials names are inconsistently used sometimes with capital, sometimes with lowercase letters. Please use only 'fly ash', 'red mud', etc, except in headings.

The authors' initials in references are also used inconsistently regarding spaces and dots.

Please use a consistent style.

There is extensive use of 'stuffing' words that are not necessary (sometimes better suited for fiction, sometimes plain wrong, e.g. on line 91). In my opinion, brevity and simplicity are more suitable for a technical paper.

#### Specific:

9: involved -> used [or] employed

10: being divulged on the basis of some -> are focused on

13: with 10 -> of 10

18: has been -> have been

being visible -> increase was visible

19: dense film at interface -> dense film at the interface

24: the promising -> a promising

25: some advanced -> advanced

29: The coatings - > Coatings

considerable amount of hardness -> considerable hardness

30: resistive -> resistant

32: carbides of ceramic and tungsten -> tungsten and chromium carbides

[carbide itself is a ceramic]

|                     | 167: Porosity -> porosity   |
|                     | 178: in turn authenticates -> supports  |
|                     | 179: as obtained -> obtained  |
|                     | 181: put -> were put  |
|                     | 182: phases -> phases,  |

### **SDI Review Form 1.6**

183: different distinct -> distinct

are allowed -> allowed

184: Micro hardness -> microhardness

with the help of -> with a

using 50 Pa (0.493 N) -> using 0.493 N load

200: were being recorded by using -> were recorded by

201: accuracy up to second decimal limit (0.01 mg) -> precision of 0.01 mg,

204: are -> were

214: chalked out -> carried out

222: of operating power being -> power are

223: (a) -> (a),

224: found to be increased -> found to increase

225: for first -> during the first

affirmed – assumed

226: drastic increasing trend -> drastic increase

227: due to -> to

This is one fact indicating the more hardness ->

This fact may indicate higher hardness

229: coating property variations bearing

less hardness -> reduced hardness

232: being illustrated -> illustrated

indicative trend -> time evolution

233: are -> is

Substantial -> Initial

234: was being visible -> is visible,

235: was constant -> was roughly constant

pertaining to -> in

239: resulted attributing to -> affected by

be enhanced -> decrease with power

240: departing result -> increase again

be lied -> be

246: reported [18] -> reported in [18]

247: is observed -> was observed

248: power -> power,

## **SDI Review Form 1.6**
