

Editor's Comment:

The revised version of the manuscript presents an interesting low-cost design of MBILS, which is applicable. The authors describe in detail how to technically design/select each module. Compared with the previous version, the authors have tried their best to polish English sentences according to the reviewers' feedback. Most important, I am glad to see the authors add the tests with illustrative figures in "Discussion" section to validate their design. The results have proved the design is reliable. Although this version is not perfect in terms of writing, it is acceptable.

I recommend the revised manuscript for publication.
